#### 11.11 Additional Information

RTECS: 0G4550000 Lead salts have been reported to cross the placenta and to induce embryoand feto- mortality. They also have teratogenic effect in some animal species. No teratogenic
effects have been reported with exposure to organometallic lead compounds. Adverse effects of
lead on human reproduction, embryonic and fetal development, and postnatal (e.g. mental)
development have been reported. Excessive exposure can affect blood, nervous, and digestive
systems. The synthesis of hemoglobin is inhibited and results in anemia. If left untreated,
neuromuscular dysfunction, possible paralysis, and encephalopathy can result. Additional
symptoms of overexposure include: joint and muscle pain, weakness of the extensor muscles
(frequently the hand and wrist), headache, dizziness, abdominal pain, diarrhea, constipation,
nausea, vomiting, blue line on the gums, insomnia, and metallic taste. High body levels
produce increased cerebrospinal pressure, brain damage, and stupor leading to coma and often
death. To the best of our knowledge, the chemical, physical, and toxicological properties
have not been thoroughly investigated.
